MOULDING AND CASTING OF FRUITS AND VEGETABLES

EE23B112, EE23B013, EP23B022

STEPS

One Plaster Mould

3 casts in clay Pop and resin

Painting the casts

MAKING THE MOULD

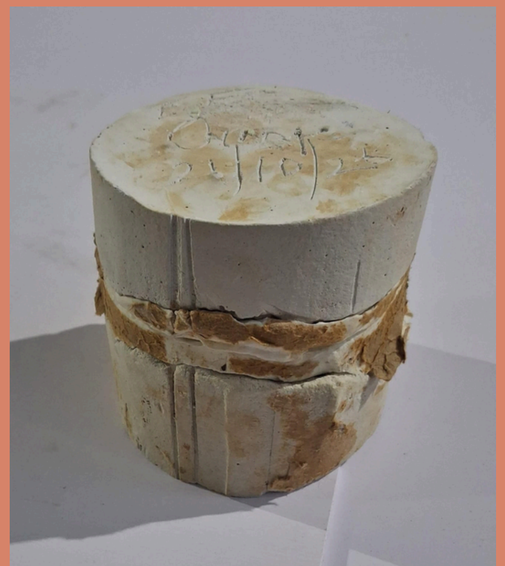

We had a slight scare when the silicone layers weren't seperating, but that was only beause they hadn't set. After 2 days, the mould came out perfectly.

The main mistake we made here was spreading the silicone layer to the edges. It has two consequences, first that the layers might merge and become difficult to seperate. Second that it's difficult to make markings on silicone to know where the mould should connect.

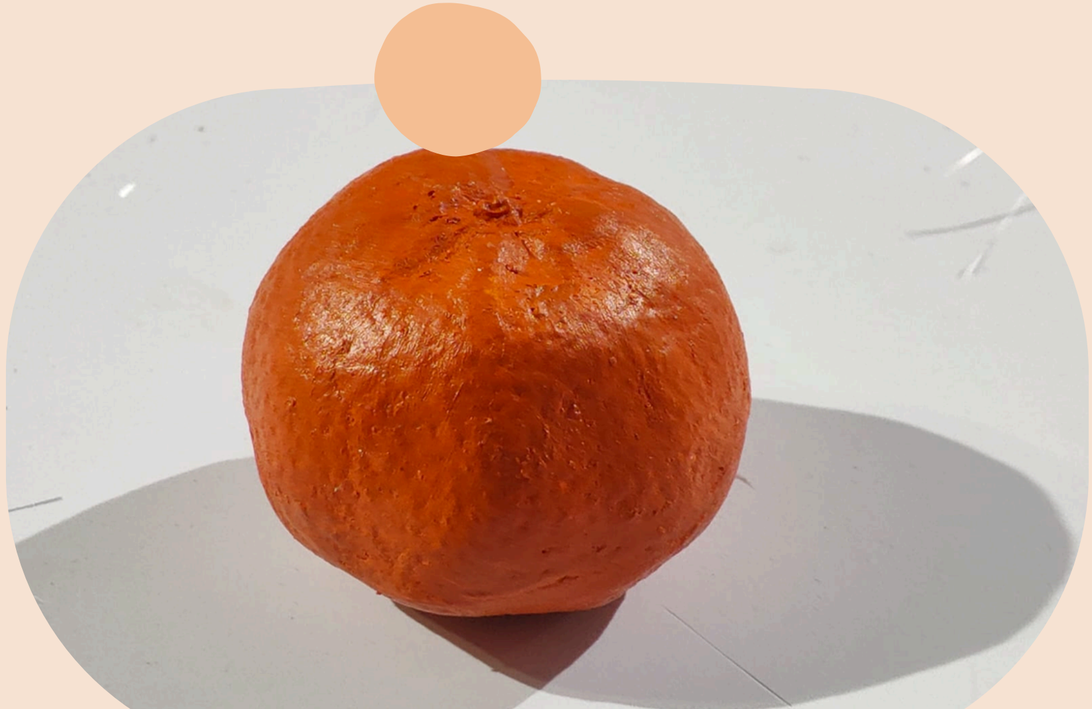

Some Fun with the Excess Silicone

Pop cast

Due to tears in the silicone, in the mould there were very small deformations in the cast. There was also a very small gap noticeable when joining the two halfs, we used very thin poppaste to cover that up, after gluing the two halfs together, and very carefully taking off the excess pop.

CLAY CAST

This was our hardest cast to make. We had 3 failed attempts, through which we learnt some important lessons about expecting the unexpected with clay.

FINALLY GOT IT!

RESIN CAST

And finally we made the resin cast with the cucumber mould. We made appropriate markings to ensire that the parts would join together perfectly.

THANK YOU
