Carving

Medha Girish, EE23B112

Foam

Subtraction is different from additive sculpting because it is more permanent. This is harder to some extent, because you cannot simply add back an element after you have carved it off. The foam was quite nice to work with - I enjoyed the process. I didn't have a clear idea going in, since the instructions given were to make something abstract; I wanted some sort of form that represented growth or blooming, and I made an abstract rose with vines spreading out from the bud. It was a nice experience, I enjoyed seeing my visualisation slowly take shape and materialise as I subtracted more.

Plaster of Paris

I wanted to create a face with my smaller carving - I've read a lot of Manga as a child, and they often use this art style for their comics that show only the eyes to convey the full expression, with very distinct eye angles and eyebrows. I tried something along these lines.

Creations.

For the pillar, I tried to make some simple patterns. I made this mistake of waiting too long after setting the plaster, and it had become quite hard to carve. I am still satisfied with the result - the depth that subtraction brings in comes into play giving a whittled wood effect.
